

**About COLLABLOCATION**  
<https://collablocation.shinyapps.io/home>

**COLLABLOCATION** is a collaborative laboratory for location analysis and planning. This online mapping platform is designed for use in hands-on interactive workshops where stakeholders break up into small groups to propose and analyze a system of locations, and then come together to compare and discuss each group's design, and repeat through several rounds of improvement. This GIS-facilitated process, known as "geodesign," succeeds by tapping into and channeling the collective intelligence of a group of stakeholders and experts.

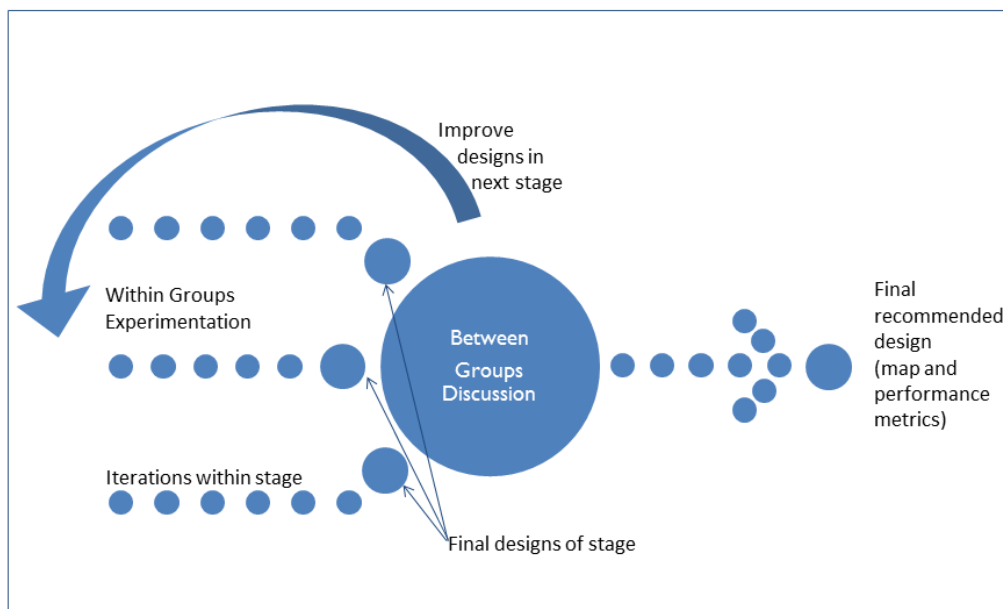

**What is Geodesign?** Geodesign is an emerging field within the general category of participatory planning and GIS. For our purposes, we define geodesign as:

*Geodesign is a collaborative design and planning method for stakeholders that tightly couples creation of design proposals with impact simulations informed by the geographic context and systems thinking, normally facilitated by GIS.* (This definition of geodesign is modified from Flaxman (2010) as amended by Stephen Ervin, see [www.spatial.redlands.edu/geodesign/](http://www.spatial.redlands.edu/geodesign/) for other definitions).

A history of geodesign as a concept and term can be found at [www.esri.com/library/whitepapers/pdfs/introducing-geodesign.pdf](http://www.esri.com/library/whitepapers/pdfs/introducing-geodesign.pdf). Two other well-know software packages for geodesign are [www.geodesignhub.com/](http://www.geodesignhub.com/) and [blogs.esri.com/esri/arcgis/2014/06/02/introducing-geoplanner-for-arcgis/](http://blogs.esri.com/esri/arcgis/2014/06/02/introducing-geoplanner-for-arcgis/).

**Geodesign for points.** Geodesign has been mainly applied to land-use planning, and most geodesign software has been created with polygons (land parcels) in mind as the primary decision units. In contrast, COLLABLOCATION has been created with point facilities in mind. While it is true that every point facility—a school, fire station, shopping mall, hospital, or fuel station—has an areal extent if you zoom in enough, COLLABLOCATION was created specifically to be able to treat facilities as points in GIS, and to evaluate a set of existing and new facilities as a *system* of point facilities. Users can visualize all kinds of GIS data including points, lines, and polygons, but the decisions COLLABLOCATION users make are where to locate a set of points. Clicking on the map drops a "point" marker at that location, and clicking on Evaluate and Save analyzes the performance of a proposed set of new facilities in conjunction with the existing facilities.

**Multi-group, multi-stage workflow.** For a collaborative, workshop-based design process, geodesign software must not only provide GIS tools and scientific submodels that an individual analyst might employ, but must also facilitate a collaborative, multi-group, multi-stage workflow. Thus, COLLABLOCATION keeps track of every tested map, the individual locations chosen, and the system's performance by each group at every stage. It includes features and tabs specifically for graphical and spatial comparison of multiple plans. At each stage of the workshop (or evolution of the planning), each group can design, analyze, and save multiple iterations. In addition, at any iteration of any stage, a group can import a previous solution designed by themselves or another group and use that as the basis for further modifications.

**Potential applications.** The initial funding to develop COLLABLOCATION was for collaborative design of a network of compressed natural gas (CNG) fuel stations for long-haul, heavy-duty trucking. The GIS layers and evaluation submodels were therefore designed specifically for this purpose, but can be readily adapted to:

- electric vehicles, fuel-cell vehicles, or other alt-fuel vehicles
- consumers and/or fleets
- any geographic scale from local to international

In addition, we hope that analysts will adapt this open-source software to other facility location problems where multiple stakeholders are involved, such as schools, fire stations, medical facilities, retail centers, waste facilities, industrial facilities, parks, transit stations, libraries, and other public or private facilities that are best analyzed at the scale where they can be treated as points on a map or transport network.

**Acknowledgements.** COLLABLOCATION was developed at Arizona State University, School of Geographical Sciences and Urban Planning in 2016-17. Project team members include:

- **Project Director:** Michael Kuby, Professor, School of Geographical Sciences and Urban Planning, ASU
- **Programmer, Designer, and Systems Engineer:** Fangwu Wei, Post-Doctoral Scholar, School of Geographical Sciences and Urban Planning, ASU
- Daoqin Tong, Associate Professor, School of Geographical Sciences and Urban Planning, ASU (formerly at University of Arizona when the project started)
- John Fowler, Professor and Chair, Department of Supply Chain Management, ASU
- Keiron Bailey, Associate Professor, School of Geography and Development, University of Arizona
- Qing Zhong, PhD student, School of Geography and Development, University of Arizona.
- Oscar Lopez, PhD student, School of Geographical Sciences and Urban Planning, ASU

COLLABLOCATION was first created as one component of a larger project on efficient, safe, and sustainable freight transportation along the I-10 corridor, funded by the Arizona Board of Regents, Research Innovation Fund (ABOR-RIF). We gratefully acknowledge ABOR's support, and that of Dr. Lawrence Head at University of Arizona and Dr. Edward Smaglik of Northern Arizona University, who, along with Dr. Kuby, led the larger Tri-University ABOR-RIF I-10 project. We also thank Dr. Scott Kelley, Assistant Professor at University of Nevada at Reno, Department of Geography, for helping Dr. Kuby conceive of the point-based geodesign approach to fuel station location while he was an Instructor at ASU. Finally, we gratefully acknowledge the support, insights, and enthusiasm of Bill Sheaffer, Executive Director of Valley of the Sun Clean Cities Coalition, located at ASU's Skysong Campus. As director of a stakeholder group himself, Bill has helped us in countless ways, including by hosting our pilot workshop and relentlessly promoting our software.
